TITLE OF THE INVENTION

## INHIBITORS OF FARNESYL-PROTEIN TRANSFERASE

BACKGROUND OF THE INVENTION

- 5           The Ras proteins (Ha-Ras, Ki4a-Ras, Ki4b-Ras and N-Ras) are part of a signalling pathway that links cell surface growth factor receptors to nuclear signals initiating cellular proliferation. Biological and biochemical studies of Ras action indicate that Ras functions like a G-regulatory protein. In the inactive state, Ras is bound to GDP. Upon growth factor receptor activation Ras is induced to exchange GDP for GTP and undergoes a conformational change. The GTP-bound form of Ras propagates the growth stimulatory signal until the signal is terminated by the intrinsic GTPase activity of Ras, which returns the protein to its inactive GDP bound form (D.R. Lowy and D.M. Willumsen, *Ann. Rev. Biochem.* 62:851-891 (1993)). Mutated *ras* genes (Ha-*ras*, Ki4a-*ras*, Ki4b-*ras* and N-*ras*) are found in many human cancers, including colorectal carcinoma, exocrine pancreatic carcinoma, and myeloid leukemias. The protein products of these genes are defective in their GTPase activity and constitutively transmit a growth stimulatory signal.
- 20           Ras must be localized to the plasma membrane for both normal and oncogenic functions. At least 3 post-translational modifications are involved with Ras membrane localization, and all 3 modifications occur at the C-terminus of Ras. The Ras C-terminus contains a sequence motif termed a "CAAX" or "Cys-Aaa<sup>1</sup>-Aaa<sup>2</sup>-Xaa" box (Cys is cysteine, Aaa is an aliphatic amino acid, the Xaa is any amino acid) (Willumsen *et al.*, *Nature* 310:583-586 (1984)). Depending on the specific sequence, this motif serves as a signal sequence for the enzymes farnesyl-protein transferase or geranylgeranyl-protein transferase, which catalyze the alkylation of the cysteine residue of the CAAX motif with a C<sub>15</sub> or C<sub>20</sub> isoprenoid, respectively. (S. Clarke., *Ann. Rev. Biochem.* 61:355-386 (1992); W.R. Schafer and J. Rine, *Ann. Rev. Genetics* 30:209-237 (1992)). The Ras protein is one of several proteins that are known to undergo post-translational farnesyl-
- 30

ation. Other farnesylated proteins include the Ras-related GTP-binding proteins such as Rho, fungal mating factors, the nuclear lamins, and the gamma subunit of transducin. James, et al., *J. Biol. Chem.* 269, 14182 (1994) have identified a peroxisome associated protein Pxf which is also  
5 farnesylated. James, et al., have also suggested that there are farnesylated proteins of unknown structure and function in addition to those listed above.

Inhibition of farnesyl-protein transferase has been shown to block the growth of Ras-transformed cells in soft agar and to modify  
10 other aspects of their transformed phenotype. It has also been demonstrated that certain inhibitors of farnesyl-protein transferase selectively block the processing of the Ras oncoprotein intracellularly (N.E. Kohl *et al.*, *Science*, 260:1934-1937 (1993) and G.L. James *et al.*, *Science*, 260:1937-1942 (1993). Recently, it has been shown that an inhibitor of  
15 farnesyl-protein transferase blocks the growth of *ras*-dependent tumors in nude mice (N.E. Kohl *et al.*, *Proc. Natl. Acad. Sci U.S.A.*, 91:9141-9145 (1994) and induces regression of mammary and salivary carcinomas in *ras* transgenic mice (N.E. Kohl *et al.*, *Nature Medicine*, 1:792-797 (1995).

20 Indirect inhibition of farnesyl-protein transferase *in vivo* has been demonstrated with lovastatin (Merck & Co., Rahway, NJ) and compactin (Hancock *et al.*, *ibid*; Casey *et al.*, *ibid*; Schafer *et al.*, *Science* 245:379 (1989)). These drugs inhibit HMG-CoA reductase, the rate limiting enzyme for the production of polyisoprenoids including  
25 farnesyl pyrophosphate. Farnesyl-protein transferase utilizes farnesyl pyrophosphate to covalently modify the Cys thiol group of the Ras CAAX box with a farnesyl group (Reiss *et al.*, *Cell*, 62:81-88 (1990); Schaber *et al.*, *J. Biol. Chem.*, 265:14701-14704 (1990); Schafer *et al.*, *Science*, 249:1133-1139 (1990); Manne *et al.*, *Proc. Natl. Acad. Sci USA*, 87:7541-7545 (1990)). Inhibition of farnesyl pyrophosphate  
30 biosynthesis by inhibiting HMG-CoA reductase blocks Ras membrane localization in cultured cells. However, direct inhibition of farnesyl-protein transferase would be more specific and attended by fewer side effects than would occur with the required dose of a general inhibitor

of isoprene biosynthesis.

Inhibitors of farnesyl-protein transferase (FPTase) have been described in four general classes (S. Graham, *Expert Opinion Ther. Patents*, (1995) 5:1269-1285). The first are analogs of farnesyl diphosphate (FPP), while a second class of inhibitors is related to the protein substrates (e.g., Ras) for the enzyme. Bisubstrate inhibitors and inhibitors of farnesyl-protein transferase that are non-competitive with the substrates have also been described. The peptide derived inhibitors that have been described are generally cysteine containing molecules that are related to the CAAX motif that is the signal for protein prenylation. (Schaber *et al.*, *ibid*; Reiss *et al.*, *ibid*; Reiss *et al.*, *PNAS*, 88:732-736 (1991)). Such inhibitors may inhibit protein prenylation while serving as alternate substrates for the farnesyl-protein transferase enzyme, or may be purely competitive inhibitors (U.S. Patent 5,141,851, University of Texas; N.E. Kohl *et al.*, *Science*, 260:1934-1937 (1993); Graham, *et al.*, *J. Med. Chem.*, 37, 725 (1994)). In general, deletion of the thiol from a CAAX derivative has been shown to dramatically reduce the inhibitory potency of the compound. However, the thiol group potentially places limitations on the therapeutic application of FPTase inhibitors with respect to pharmacokinetics, pharmacodynamics and toxicity. Therefore, a functional replacement for the thiol is desirable.

Recently, certain tricyclic compounds which optionally incorporate a piperidine moiety have been disclosed to be inhibitors of FPTase (WO 95/10514, WO 95/10515 and WO 95/10516). Imidazole-containing compounds which are claimed to be inhibitors of farnesyl protein transferase have also been disclosed (WO 95/09001 and EP 0 675 112 A1). WO 95/09001 discloses imidazolyl containing compounds that are inhibitors of farnesyl protein transferase.

It has recently been reported that farnesyl-protein transferase inhibitors are inhibitors of proliferation of vascular smooth muscle cells and are therefore useful in the prevention and therapy of arteriosclerosis and diabetic disturbance of blood vessels (JP H7-112930).

It is, therefore, an object of this invention to develop

- low molecular weight compounds that will inhibit farnesyl-protein transferase and thus, the post-translational farnesylation of proteins. It is a further object of this invention to develop chemotherapeutic compositions containing the compounds of this invention and methods
- 5 for producing the compounds of this invention.

It is intended that the definition of any substituent or  
20 variable (e.g., R<sup>1</sup>, R<sup>2</sup>, R<sup>9</sup>, n, etc.) at a particular location in a molecule  
be independent of its definitions elsewhere in that molecule. Thus,

-N(R<sup>10</sup>)<sub>2</sub> represents -NHH, -NHCH<sub>3</sub>, -NHC<sub>2</sub>H<sub>5</sub>, etc. It is understood that substituents and substitution patterns on the compounds of the instant invention can be selected by one of ordinary skill in the art to provide compounds that are chemically stable and that can be synthesized by techniques known in the art, as well as those methods set forth below, from readily available starting materials.

The pharmaceutically acceptable salts of the compounds of this invention include the conventional non-toxic salts of the compounds of this invention as formed, e.g., from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like: and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, palmoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxy-benzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, trifluoroacetic and the like.

The pharmaceutically acceptable salts of the compounds of this invention can be synthesized from the compounds of this invention which contain a basic moiety by conventional chemical methods. Generally, the salts are prepared either by ion exchange chromatography or by reacting the free base with stoichiometric amounts or with an excess of the desired salt-forming inorganic or organic acid in a suitable solvent or various combinations of solvents.

Reactions used to generate the compounds of this invention are prepared by employing reactions as shown in the Schemes 1-17, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. Substituents R<sup>3</sup>, R<sup>6</sup> and R<sup>8</sup>, as shown in the Schemes, represent the substituents R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6a</sup>, R<sup>6b</sup>, R<sup>6c</sup>, R<sup>6d</sup>, R<sup>6e</sup> and R<sup>8</sup>; although only one such R<sup>3</sup>, R<sup>6</sup> or R<sup>8</sup> is present in the intermediates and products of the schemes, it is understood that the

reactions shown are also applicable when such aryl or heterocyclic moieties contain multiple substituents.

These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to  
5 synthesize fragments which are subsequently joined by the alkylation reactions described in the Schemes. The reactions described in the Schemes are illustrative only and are not meant to be limiting. Other reactions useful in the preparation of heteroaryl moieties are described in "Comprehensive Organic Chemistry, Volume 4:  
10 Heterocyclic Compounds" ed. P.G. Sammes, Oxford (1979) and references therein.

Synopsis of Schemes 1-17:

The requisite intermediates are in some cases  
15 commercially available, or can be prepared according to literature procedures. Schemes 1-8 illustrate synthesis of the instant bicyclic compounds which incorporate a preferred benzylimidazolyl sidechain. Thus, in Scheme 1, for example, a bicyclic intermediate that is not commercially available may be synthesized by methods  
20 known in the art. Thus, a suitably substituted pyridinonyl alcohol 2 may be synthesized starting from the corresponding isonicotinate 1 according to procedures described by Boekelhiede and Lehn (*J. Org. Chem.*, 26:428-430 (1961)). The alcohol is then protected and reacted under Ullmann coupling conditions with a suitably  
25 substituted phenyl iodide, to provide the intermediate bicyclic alcohol 3. The intermediate alcohol 3 may be converted to the corresponding bromide 4. The bromide 4 may be coupled to a suitably substituted benzylimidazolyl 5 to provide, after deprotection, the instant compound 6.

30 Schemes 2-4 illustrate methods of synthesizing related or alcohol intermediates, which can then be processed as described in Scheme 1. Thus, Scheme 2 illustrates preparation of a pyridyl-pyridinonyl alcohol and thienylpyridinonyl alcohol starting with the suitably substituted halogenated heterocycles.

Scheme 3 illustrates preparation of the intermediate bromide **9** wherein the preferred pyridinone is replaced by a saturated lactam. Acylation of a suitably substituted aniline **7** with a suitably substituted brominated acyl chloride provides the acylated intermediate **8**. Closure of the lactam ring provides the intermediate alcohol, which is converted to the bromide as described above.

Scheme 4 illustrates synthesis of an instant compound wherein a non-hydrogen  $R^{9b}$  is incorporated in the instant compound. Thus, a readily available 4-substituted imidazole **10** may be selectively iodinated to provide the 5-iodoimidazole **11**. That imidazole **11** may then be protected and coupled to a suitably substituted benzyl moiety to provide intermediate **12**. Intermediate **12** can then undergo the alkylation reactions that were described hereinabove.

Scheme 5 illustrates synthesis of instant compounds that incorporate a preferred imidazolyl moiety connected to the biaryl via an alkyl amino, sulfonamide or amide linker. Thus, the 4-amino-alkylimidazole **13**, wherein the primary amine is protected as the phthalimide, is selectively alkylated then deprotected to provide the amine **14**. The amine **14** may then react under conditions well known in the art with various activated arylheteroaryl moieties to provide the instant compounds shown.

Compounds of the instant invention wherein the  $A^1(CR^1_2)_nA^2(CR^1_2)_n$  linker is oxygen may be synthesized by methods known in the art, for example as shown in Scheme 6. The suitably substituted phenol **15** may be reacted with methyl N-(cyano)methanimidate to provide the 4-phenoxyimidazole **16**. After selective protection of one of the imidazolyl nitrogens, the intermediate **17** can undergo alkylation reactions as described for the benzylimidazoles hereinabove.

Compounds of the instant invention wherein the  $A^1(CR^1_2)_nA^2(CR^1_2)_n$  linker is a substituted methylene may be synthesized by the methods shown in Scheme 7. Thus, the

N-protected imidazolyl iodide **18** is reacted, under Grignard conditions with a suitably protected benzaldehyde to provide the alcohol **19**. Acylation, followed by the alkylation procedure illustrated in the Schemes above (in particular, Scheme 1) provides the instant compound **20**. If other R<sup>1</sup> substituents are desired, the acetyl moiety can be manipulated as illustrated in the Scheme.

Scheme 8 illustrates incorporation of an acetyl moiety as the (CR<sup>2</sup><sub>2</sub>)<sub>p</sub>X(CR<sup>2</sup><sub>2</sub>)<sub>p</sub> linker of the instant compounds. Thus, the suitably substituted acetyl pyridine **21** is converted to the corresponding pyridinone and undergoes the Ullmann reaction with a suitably substituted phenyl iodide. The acetyl is then brominated to provide intermediate **22**. Reaction with the imidazolyl reagent **5** provides, after deprotection, the instant compound **23**.

Schemes 9-17 illustrate reactions wherein the moiety

5

incorporated in the compounds of the instant invention is represented by other than a substituted imidazole-containing group.

Thus, the intermediates whose synthesis are illustrated in the Schemes, and other pyridinonecarbocyclic and pyridinoneheterocyclic intermediates obtained commercially or readily synthesized, can be coupled with a variety of aldehydes. The aldehydes can be prepared by standard procedures, such as that described by O. P. Goel, U. Krolls, M. Stier and S. Kesten in Organic Syntheses, 1988,

10

67, 69-75, from the appropriate amino acid. Knochel chemistry may be utilized, as shown in Scheme 9, to incorporate the aryl-pyridinone moiety. Thus, a suitably substituted 4-(bromo)pyridine is converted to the corresponding pyridinone **24** as described above and the pyridinone is coupled to a suitably substituted phenyl iodide as previously described above. The resulting bromide **25** is treated with zinc(0) and the resulting zinc bromide reagent **26** is reacted with an aldehyde to provide the C-alkylated instant compound **27**. Compound **27** can be deoxygenated by methods known in the art, such as a catalytic hydrogenation, then deprotected with trifluoroacetic acid in methylene chloride to give the final compound **28**. The compound **28** may be isolated in the salt form, for example, as a trifluoroacetate, hydrochloride or acetate salt, among others. The product diamine **28** can further be selectively protected to obtain **29**, which can subsequently be reductively alkylated with a second aldehyde to obtain compound **30**. Removal of the protecting group, and conversion to cyclized products such as the dihydroimidazole **31** can be accomplished by literature procedures.

If the arylpyridinone zinc bromide reagent is reacted with an aldehyde which also has a protected hydroxyl group, such as **32** in Scheme 10, the protecting groups can be subsequently removed to unmask the hydroxyl group (Schemes 10, 11). The alcohol can be oxidized under standard conditions to *e.g.* an aldehyde, which can then be reacted with a variety of organometallic reagents such as alkyl lithium reagents, to obtain secondary alcohols such as **34**. In addition, the fully deprotected amino alcohol **35** can be reductively alkylated (under conditions described previously) with a variety of aldehydes to obtain secondary amines, such as **36** (Scheme 11), or tertiary amines.

The Boc protected amino alcohol **33** can also be utilized to synthesize 2-aziridinylmethylarylheteroaryl such as **37** (Scheme 12). Treating **33** with 1,1'-sulfonyldiimidazole and sodium hydride in a solvent such as dimethylformamide led to the formation of

aziridine **37**. The aziridine is reacted with a nucleophile, such as a thiol, in the presence of base to yield the ring-opened product **38**.

In addition, the arylpyridinone reagent can be reacted with aldehydes derived from amino acids such as O-alkylated tyrosines, according to standard procedures, to obtain compounds such as **40**, as shown in Scheme 13. When R' is an aryl group, **40** can first be hydrogenated to unmask the phenol, and the amine group deprotected with acid to produce **41**. Alternatively, the amine protecting group in **40** can be removed, and O-alkylated phenolic amines such as **42** produced.

Schemes 14-17 illustrate syntheses of suitably substituted aldehydes useful in the syntheses of the instant compounds wherein the variable W is present as a pyridyl moiety. Similar synthetic strategies for preparing alkanols that incorporate other heterocyclic moieties for variable W are also well known in the art.

- The instant compounds are useful as pharmaceutical agents for mammals, especially for humans. These compounds may be administered to patients for use in the treatment of cancer. Examples of the type of cancer which may be treated with the compounds of this invention include, but are not limited to, colorectal carcinoma, exocrine

pancreatic carcinoma, myeloid leukemias and neurological tumors. Such tumors may arise by mutations in the *ras* genes themselves, mutations in the proteins that can regulate Ras activity (i.e., neurofibromin (NF-1), neu, scr, ab1, lck, fyn) or by other mechanisms.

5           The compounds of the instant invention inhibit farnesyl-protein transferase and the farnesylation of the oncogene protein Ras. The instant compounds may also inhibit tumor angiogenesis, thereby affecting the growth of tumors (J. Rak et al. *Cancer Research*, 55: 4575-4580 (1995)). Such anti-angiogenesis properties of the instant  
10       compounds may also be useful in the treatment of certain forms of blindness related to retinal vascularization.

          The compounds of this invention are also useful for inhibiting other proliferative diseases, both benign and malignant, wherein Ras proteins are aberrantly activated as a result of oncogenic  
15       mutation in other genes (i.e., the Ras gene itself is not activated by mutation to an oncogenic form) with said inhibition being accomplished by the administration of an effective amount of the compounds of the invention to a mammal in need of such treatment. For example, a  
20       component of NF-1 is a benign proliferative disorder.

          The instant compounds may also be useful in the treatment of certain viral infections, in particular in the treatment of hepatitis delta and related viruses (J.S. Glenn et al. *Science*, 256:1331-1333 (1992)).

          The compounds of the instant invention are also useful in  
25       the prevention of restenosis after percutaneous transluminal coronary angioplasty by inhibiting neointimal formation (C. Indolfi et al. *Nature medicine*, 1:541-545(1995)).

          The instant compounds may also be useful in the treatment and prevention of polycystic kidney disease (D.L. Schaffner et al. *American Journal of Pathology*, 142:1051-1060 (1993) and B. Cowley, Jr. et al. *FASEB Journal*, 2:A3160 (1988)).  
30       

          The instant compounds may also be useful for the treatment of fungal infections.

The instant compounds may also be useful as inhibitors of proliferation of vascular smooth muscle cells and therefore useful in the prevention and therapy of arteriosclerosis and diabetic disturbance of blood vessels.

5           The compounds of this invention may be administered to mammals, preferably humans, either alone or, preferably, in combination with pharmaceutically acceptable carriers or diluents, optionally with known adjuvants, such as alum, in a pharmaceutical composition, according to standard pharmaceutical practice. The compounds can be  
10 administered orally or parenterally, including the intravenous, intramuscular, intraperitoneal, subcutaneous, rectal and topical routes of administration.

For oral use of a chemotherapeutic compound according to this invention, the selected compound may be administered, for  
15 example, in the form of tablets or capsules, or as an aqueous solution or suspension. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch, and lubricating agents, such as magnesium stearate, are commonly added. For oral administration in capsule form, useful diluents include lactose and dried corn  
20 starch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring agents may be added. For intramuscular, intraperitoneal, subcutaneous and intravenous use, sterile solutions of the active ingredient are usually prepared, and the pH of the  
25 solutions should be suitably adjusted and buffered. For intravenous use, the total concentration of solutes should be controlled in order to render the preparation isotonic.

The compounds of the instant invention may also be co-administered with other well known therapeutic agents that are selected  
30 for their particular usefulness against the condition that is being treated. For example, the instant compounds may be useful in combination with known anti-cancer and cytotoxic agents. Similarly, the instant compounds may be useful in combination with agents that are effective in the treatment and prevention of NF-1, retinosis, polycystic kidney

disease, infections of hepatitis delta and related viruses and fungal infections. The instant compounds may also be useful in combination with other inhibitors of parts of the signalling pathway that links cell surface growth factor receptors to nuclear signals initiating cellular proliferation. Thus, the instant compounds may be utilized in combination with farnesyl pyrophosphate competitive inhibitors of the activity of farnesyl-protein transferase or in combination with a compound which has Raf antagonist activity.

If formulated as a fixed dose, such combination products employ the compounds of this invention within the dosage range described below and the other pharmaceutically active agent(s) within its approved dosage range. Compounds of the instant invention may alternatively be used sequentially with known pharmaceutically acceptable agent(s) when a combination formulation is inappropriate.

The present invention also encompasses a pharmaceutical composition useful in the treatment of cancer, comprising the administration of a therapeutically effective amount of the compounds of this invention, with or without pharmaceutically acceptable carriers or diluents. Suitable compositions of this invention include aqueous solutions comprising compounds of this invention and pharmacologically acceptable carriers, e.g., saline, at a pH level, e.g., 7.4. The solutions may be introduced into a patient's blood-stream by local bolus injection.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specific amounts, as well as any product which results, directly or indirectly, from combination of the specific ingredients in the specified amounts.

When a compound according to this invention is administered into a human subject, the daily dosage will normally be determined by the prescribing physician with the dosage generally varying according to the age, weight, and response of the individual patient, as well as the severity of the patient's symptoms.

In one exemplary application, a suitable amount of compound is administered to a mammal undergoing treatment for

cancer. Administration occurs in an amount between about 0.1 mg/kg of body weight to about 60 mg/kg of body weight per day, preferably of between 0.5 mg/kg of body weight to about 40 mg/kg of body weight per day.

5           The compounds of the instant invention are also useful as a component in an assay to rapidly determine the presence and quantity of farnesyl-protein transferase (FPTase) in a composition. Thus the composition to be tested may be divided and the two  
10 portions contacted with mixtures which comprise a known substrate of FPTase (for example a tetrapeptide having a cysteine at the amine terminus) and farnesyl pyrophosphate and, in one of the mixtures, a compound of the instant invention. After the assay mixtures are incubated for an sufficient period of time, well known in the art, to allow the FPTase to farnesylate the substrate, the chemical content  
15 of the assay mixtures may be determined by well known immunological, radiochemical or chromatographic techniques. Because the compounds of the instant invention are selective inhibitors of FPTase, absence or quantitative reduction of the amount of substrate in the assay mixture without the compound of the instant invention  
20 relative to the presence of the unchanged substrate in the assay containing the instant compound is indicative of the presence of FPTase in the composition to be tested.

          It would be readily apparent to one of ordinary skill in the art that such an assay as described above would be useful in identifying  
25 tissue samples which contain farnesyl-protein transferase and quantitating the enzyme. Thus, potent inhibitor compounds of the instant invention may be used in an active site titration assay to determine the quantity of enzyme in the sample. A series of samples composed of aliquots of a tissue extract containing an unknown amount of farnesyl-  
30 protein transferase, an excess amount of a known substrate of FPTase (for example a tetrapeptide having a cysteine at the amine terminus) and farnesyl pyrophosphate are incubated for an appropriate period of time in the presence of varying concentrations of a compound of the instant invention. The concentration of a sufficiently potent inhibitor (i.e., one

that has a  $K_i$  substantially smaller than the concentration of enzyme in the assay vessel) required to inhibit the enzymatic activity of the sample by 50% is approximately equal to half of the concentration of the enzyme in that particular sample.

#### EXAMPLE 1

15    4-[3-(2-Oxo-1-phenyl-1,2-dihydropyridin-4-ylmethyl)-3H-imidazol-4-ylmethyl]benzonitrile

Step 1:    4-Hydroxymethyl-1H-pyridin-2-one

20            2-Oxo-1,2-dihydropyridine-4-carboxylic acid methyl ester (1.8g, 12.2 mmol), prepared as described in *J. Org. Chem.*, 26, 428 (1961), was suspended in THF(100ml). A small amount of DMF was added to help increase solubility.  $\text{LiBH}_4$  (61 mmol) was added and the reaction was stirred for 18 hours at room temperature. MeOH and  $\text{H}_2\text{O}$  are added to quench the reaction. The reaction is then concentrated to yield a yellow oil. Flash chromatography (5% MeOH/ $\text{CHCl}_3$  to 20% MeOH/ $\text{CHCl}_3$ ) yielded 4-hydroxymethyl-1H-pyridin-2-one as a white solid.

25             $^1\text{H}$  NMR (400 MHz,  $\text{CD}_3\text{OD}$ )  $\delta$  7.38-7.36 (1H,d); 6.56 (s, 1H); 6.37-6.36 (d, 1H); 4.50 s, 2H).

30

Step 2:    4-(tert-butyldimethylsilyloxymethyl)-1H-pyridin-2-one

4-Hydroxymethyl-1H-pyridin-2-one from Step 1 (1.3g, 10.5 mmol) was dissolved in DMF. t-Butyl dimethylsilyl chloride (12.6 mmol, 1.9g) and imidazole (12.6 mmol, 858 mg) were added and the

reaction was stirred for 16 hours. The reaction mixture was diluted with EtOAc and washed with H<sub>2</sub>O (2x) and brine. The organic layer was dried (MgSO<sub>4</sub>), filtered and concentrated to yield a yellow oil.

Flash chromatography (EtOAc) yielded 4-(tert-butyldimethylsilyloxymethyl)-1H-pyridin-2-one as an off white solid.

<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.30-7.28 (d, 1H); 6.60 (s, 1H); 6.20-6.18 (d, 1H); 4.58 (s, 2H); 0.955 (s, 9H); 0.11 (s, 6H).

10 Step 3: 4-(tert-butyl-dimethyl-silanyloxymethyl)-1-phenyl-1H-pyridin-2-one  
4-(Tert-butyldimethylsilyloxymethyl)-1H-pyridin-2-one from Step 2 (1.5g, 6.3 mmol) was dissolved in iodobenzene (189 mmol, 21.12 mL) and treated with copper (6.3 mmol, 400 mg) and K<sub>2</sub>CO<sub>3</sub> (6.93 mmol, 958 mg.). The brown slurry was heated to 180° for 16  
15 hrs. The reaction mixture was cooled, diluted with CHCl<sub>3</sub> and washed with saturated NaHCO<sub>3</sub>. The aqueous layer was back extracted with CHCl<sub>3</sub> (2x). The organic layers were combined, washed with brine, dried (MgSO<sub>4</sub>), filtered and concentrated to yield a yellow oil. Flash  
20 Chromatography (20% EtOAc/Hexane) yielded 4-(tert-butyl-dimethyl-silanyloxymethyl)-1-phenyl-1H-pyridin-2-one as a white solid.  
<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.49-7.47 (m, 2H); 7.43-7.39 (m, 3H); 7.29-7.28 (d, 2H); 6.65 (s, 1H); 6.19 (d, 2H); 4.59 (s, 2H); 0.97 (s, 9H); 0.14 (s, 6H).

25 Step 4: 4-Hydroxymethyl-1-phenyl-1H-pyridin-2-one  
4-(Tert-butyl-dimethyl-silyloxymethyl)-1-phenyl-1H-pyridin-2-one from Step 3 (1.3g) was dissolved in TBAF in 1M THF (15 mL). The clear reaction mixture was stirred for 16 hours. The  
30 reaction mixture was concentrated and purified on a column of silica eluting with 10% MeOH/EtOAc to yield 4-hydroxymethyl-1-phenyl-1H-pyridin-2-one as a tan solid.  
<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.5-7.47 (m, 2H); 7.43 (d, 1H); 7.38-7.36 (m, 2H); 7.32-7.30 (d, 1H) 6.67 (s, 1H); 6.23 (d, 1H) 4.57 (d, 2H).

Step 5: 4-Bromomethyl-1-phenyl-1H-pyridin-2-one

4-Hydroxymethyl-1-phenyl-1H-pyridin-2-one from Step 4 (1.0g, 5 mmol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub>. CBr<sub>4</sub> (6 mmol, 2g) was added and the reaction mixture was cooled to 0°. PPh<sub>3</sub> (6 mmol, 2.0 g) was

The suspension was cooled to 0°C and α-bromo-p-tolunitrile (9.33g, 47.6 mmol) in THF (100 mL) was added dropwise over a period of 10 minutes. The reaction was then allowed to stir at 20°C for 6 hours and bis(triphenyl-

The resulting mixture was stirred 16 hours at 20°C and then quenched by addition of saturated NH<sub>4</sub>Cl solution (100 mL) and the mixture stirred for 2 hours. Saturated aq. NaHCO<sub>3</sub> solution was added to give a pH

After 30 minutes the reaction became homogeneous. The reaction mixture was heated to 80° for 16 hours. The heterogeneous reaction mixture was concentrated, taken up in MeOH and refluxed for 1 hour. The reaction mixture was cooled, diluted with CHCl<sub>3</sub> and washed with saturated NaHCO<sub>3</sub>. The aqueous layer was back extracted 4 times with CHCl<sub>3</sub>. The organic layers were combined, washed with brine, dried (MgSO<sub>4</sub>), filtered and concentrated to yield a yellow solid which was purified by flash chromatography (7% i-PrOH/CHCl<sub>3</sub> saturated with NH<sub>3</sub>). Purest fractions were collected and concentrated to yield a white solid which was triturated with EtOAc. The solids were filtered, washed with EtOAc and dried under hi-vacuum for 16 hours to yield 4-[3-(2-Oxo-1-phenyl-1,2-dihydropyridin-4-ylmethyl)-3H-imidazol-4-ylmethyl]benzonitrile, hydrochloride as a white solid.

### EXAMPLE 23

#### 20 *In vitro* inhibition of ras farnesyl transferase

- Assays of farnesyl-protein transferase.* Partially purified bovine FPTase and Ras peptides (Ras-CVLS, Ras-CVIM and Ras-CAIL) were prepared as described by Schaber *et al.*, *J. Biol. Chem.* 265:14701-14704 (1990), Pompliano, *et al.*, *Biochemistry* 31:3800 (1992) and
- 25 Gibbs *et al.*, *PNAS* U.S.A. 86:6630-6634 (1989), respectively. Bovine FPTase was assayed in a volume of 100  $\mu\text{l}$  containing 100 mM *N*-(2-hydroxy ethyl) piperazine-*N'*-(2-ethane sulfonic acid) (HEPES), pH 7.4, 5 mM  $\text{MgCl}_2$ , 5 mM dithiothreitol (DTT), 100 mM [ $^3\text{H}$ ]-farnesyl diphosphate ([ $^3\text{H}$ ]-FPP; 740 CBq/mmol, New England Nuclear), 650 nM
- 30 Ras-CVLS and 10  $\mu\text{g/ml}$  FPTase at 31°C for 60 min. Reactions were initiated with FPTase and stopped with 1 ml of 1.0 M HCL in ethanol. Precipitates were collected onto filter-mats using a TomTec Mach II cell harvester, washed with 100% ethanol, dried and counted in an LKB

$\beta$ -plate counter. The assay was linear with respect to both substrates, FPTase levels and time; less than 10% of the [ $^3\text{H}$ ]-FPP was utilized during the reaction period. Purified compounds were dissolved in 100% dimethyl sulfoxide (DMSO) and were diluted 20-fold into the  
5 assay. Percentage inhibition is measured by the amount of incorporation of radioactivity in the presence of the test compound when compared to the amount of incorporation in the absence of the test compound.

Human FPTase was prepared as described by Omer *et al.*,  
10 Biochemistry 32:5167-5176 (1993). Human FPTase activity was assayed as described above with the exception that 0.1% (w/v) polyethylene glycol 20,000, 10  $\mu\text{M}$   $\text{ZnCl}_2$  and 100 nM Ras-CVIM were added to the reaction mixture. Reactions were performed for 30 min., stopped with 100  $\mu\text{l}$  of 30% (v/v) trichloroacetic acid (TCA) in ethanol  
15 and processed as described above for the bovine enzyme.

The compounds of the instant invention described in the above Examples 1-22 were tested for inhibitory activity against human FPTase by the assay described above and were found to have  $\text{IC}_{50}$  of  
20  $<50 \mu\text{M}$ .

Cells in 10 cm dishes at 50-75% confluency are treated with the test compound (final concentration of solvent, methanol or dimethyl sulfoxide, is 0.1%). After 4 hours at  
30  $37^\circ\text{C}$ , the cells are labelled in 3 ml methionine-free DMEM supplemented with 10% regular DMEM, 2% fetal bovine serum and 400  $\text{mCi}[^{35}\text{S}]\text{methionine}$  (1000  $\text{Ci}/\text{mmol}$ ). After an additional 20 hours, the cells are lysed in 1 ml lysis buffer (1% NP40/20 mM HEPES, pH 7.5/5 mM  $\text{MgCl}_2$ /1mM DTT/10 mg/ml aprotinin/2 mg/ml leupeptin/2 mg/ml

antipain/0.5 mM PMSF) and the lysates cleared by centrifugation at 100,000 x g for 45 min. Aliquots of lysates containing equal numbers of acid-precipitable counts are brought to 1 ml with IP buffer (lysis buffer lacking DTT) and immunoprecipitated with the ras-specific  
5 monoclonal antibody Y13-259 (Furth, M.E. *et al.*, J. *Virology* 43:294-304, (1982)). Following a 2 hour antibody incubation at 4°C, 200 µl of a 25% suspension of protein A-Sepharose coated with rabbit anti rat IgG is added for 45 min. The immunoprecipitates are washed four times with IP buffer (20 mM HEPES, pH 7.5/1 mM EDTA/1% Triton X-  
10 100.0.5% deoxycholate/0.1%/SDS/0.1 M NaCl) boiled in SDS-PAGE sample buffer and loaded on 13% acrylamide gels. When the dye front reached the bottom, the gel is fixed, soaked in Enlightening, dried and autoradiographed. The intensities of the bands corresponding to farnesylated and nonfarnesylated ras proteins are compared to

20 To determine the biological consequences of FPTase inhibition, the effect of the compounds of the instant invention on the anchorage-independent growth of Rat1 cells transformed with either a *v-ras*, *v-raf*, or *v-mos* oncogene is tested. Cells transformed by v-Raf and v-Mos may be included in the analysis to evaluate the specificity of  
25 instant compounds for Ras-induced cell transformation.

Rat 1 cells transformed with either *v-ras*, *v-raf*, or *v-mos* are seeded at a density of  $1 \times 10^4$  cells per plate (35 mm in diameter) in a 0.3% top agarose layer in medium A (Dulbecco's modified Eagle's medium supplemented with 10% fetal bovine serum) over a bottom  
30 agarose layer (0.6%). Both layers contain 0.1% methanol or an appropriate concentration of the instant compound (dissolved in methanol at 1000 times the final concentration used in the assay). The cells are fed twice weekly with 0.5 ml of medium A containing 0.1% methanol or the

concentration of the instant compound. Photomicrographs are taken 16 days after the cultures are seeded and comparisons are made.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US97/23888**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☒ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:  
1-26 and 32-33 in part
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐

The additional search fees were accompanied by the applicant's protest.

☒

No protest accompanied the payment of additional search fees.

## BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

The following table defines the inventions claimed in this application. By selecting a single radical from each of the following variables (as defined in Formula A): W,  $-(CR_2)_p-X-(CR_2)_p$ , Q, and Y and a single method of use, one can arrive at 168 groups.

### Variables of Formula A

W - a<sup>1</sup>) heterocycle,  
b<sup>1</sup>) absent;

$-(CR_2)_p-X-(CR_2)_p$  - a<sup>2</sup>)  $-CH_2-$ ,  
b<sup>2</sup>)  $-O-$ ;

Q - a<sup>3</sup>) 4-7 membered ring with 1-3 nitrogens,  
b<sup>3</sup>) 4-7 membered ring with nitrogen and/or sulfur and/or oxygen;

Y - a<sup>4</sup>) 5-7 membered carbocyclic ring,  
b<sup>4</sup>) 5-7 membered ring with nitrogen as the only heteroatom,  
c<sup>4</sup>) 5-7 membered ring with nitrogen and/or sulfur and/or oxygen;

### Method of Treating Diseases Groups

- I) cancer,
- II) neurofibromin benign proliferative disorder,
- III) blindness related to retinal vascularization,
- IV) hepatitis delta and related viral infections,
- V) restenosis,
- VI) polycystic kidney disease,
- VII) antifungal.

The variables as defined supra combine to form 168 groups. For complete coverage of the claimed subject matter, a separate compound group and a separate method group encompassing the instantly claimed compounds and methods not represented by the 168 groups are included resulting in a total of 170 groups. Please note, the elected method group(s), composition (claim 32) and process (claim 33) will be examined to the extent each reads on the elected compound group(s).

A sample selection of an individual group is as follows:

Group I, claims 10-12 and 1-9, 15-26 in part, drawn to compounds, compositions and methods of use wherein the compound is of Formula A, wherein W = heterocycle;  $-(CR_2)_p-X-(CR_2)_p$  =  $-CH_2-$ ; Q = 4-7 membered ring with 1-3 nitrogens; Y = carbocycle; method of treating cancer.

In a communication faxed April 24, 1998, Applicant's Attorney, Mr. David Muthard paid for 2 additional groups. Accordingly a search will be performed for a compound of Formula A wherein W = heterocycle;  $-(CR_2)_p-X-(CR_2)_p$  =  $-CH_2-$ ; Q = 4-7 membered ring with 1-3 nitrogens; Y = carbocycle, a 5-7 membered ring with nitrogen as the only heteroatom, and a 5-7 membered ring with nitrogen and/or sulfur and/or oxygen; method of treating cancer.

The inventions listed as Groups 1-170 do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: there is NO SIGNIFICANT STRUCTURAL ELEMENT shared by all of the alternatives just a string of variables. In accordance with Rule 13.2, Compound 11 of FURUKAWA et al US 4,340,598 is an example that at least one Markush alternative is not novel over the prior art; therefore, the finding that the instantly claimed genus of compounds lacks unity is appropriate. Regarding the multiple methods, each malady has been placed in a separate grouping since they have different etiologies, ie. a compound that is found to be useful in the treatment of cancer would not apriori be useful in the treatment of restenosis.
